

Model Development Assignment

Problem : Given a document, implement, Develop a Document Type Classifier Model :

The objective is to design, develop, and implement a robust deep learning model capable of accurately classifying an entire document image into its corresponding type (e.g., invoice, bank statement, tax form, general letter). This task is crucial for automated document processing pipelines, enabling efficient routing, indexing, and information extraction. Leverage any open source datasets for training and test.

Suggested Dataset : Identify and use any suitable open-source document image dataset (e.g., **RVL-CDIP**, **Tobacco800**, or a relevant subset of the **SROIE** dataset). Provide a clear reference/link to the chosen dataset in the final report. RVL-CDIP dataset (400,000 grayscale images, 16 classes)

Assessment Report to include : Proposed Solution and considered alternative approaches, Problem Data Analysis, Training Code, and link to the dataset, Training Validation Accuracies on the test dataset, Model Architecture explanation, Model Performance Metrics.
